Education

University of Glasgow — Glasgow, UK
Master of Science in Computing Science, ***Distinction*** — *Sep 2025 – Sep 2026*
- Coursework: Machine Learning, Deep Learning, Natural Language Processing, Information Retrieval, Algorithms

University of Mumbai — Mumbai, India
Bachelor of Engineering in Information Technology ***GPA: 8.42/10.0*** — *Feb 2021 – May 2023*
- Coursework: Data Structures, Algorithms (Java), Object-Oriented Programming, Full Stack Development (React)

Technical Skills

Languages: TypeScript, JavaScript, Python, SQL, Java, Bash, HTML, CSS
Tools and Frameworks: React, Next.js, Vue.js, Redux, React Flow, Tailwind CSS, Vite, Webpack, Node.js, Express, Flask, Kafka, Temporal, BullMQ, PostgreSQL, MySQL, SQLite, MongoDB, Mongoose, Sequelize, Redis, Jest, Specmatic, Docker, Kubernetes, Terraform, AWS (EC2, S3, Lambda), Azure, Google Cloud, Vercel, OpenTelemetry, Prometheus, Grafana, Linux
Concepts: REST APIs, WebSockets, OpenAPI, Swagger, OAuth 2.0, Microservices, Event-Driven Architecture, Contract Testing, CI/CD, Infrastructure as Code, System Design, Model Context Protocol (MCP), AI-Assisted Development, Agile / Scrum, Code Review
Developer Tools: Claude Code, Cursor, OpenAI Codex, Git, GitLab CI, GitHub Actions, Jenkins, Azure DevOps, VS Code, Jupyter Notebook

Experience

Software Development Engineer, Fynd, Mumbai, India — Aug 2023 – Aug 2025
Tech stack: TypeScript, Node.js, React, Temporal, Kafka, Kubernetes
- Led the migration of **9** external marketplace integrations onto the company's first **Temporal-orchestrated workflow engine**, rebuilding roughly **80** workflow stages and consolidating years of special-case logic into one model.
- Built the **no-code workflow builder** in **React, TypeScript and React Flow**, a drag-and-drop canvas for executable workflows with loops and branches, plus the **Next.js** interfaces for each new integration, and worked with **cross-functional teams** to migrate the front end from **Vue.js** to **React**.
- Ran inventory and order synchronisation against catalogues of up to **300,000** SKUs, integrating third-party **REST APIs** with per-seller credentials for **Shopify, Flipkart and Amazon**.
- Built the company's first integration against **Amazon's VDF feed APIs** on **BullMQ and KafkaJS**, designing an ingestion layer that hides asynchronous feed completion and rate limits so new orders keep flowing.
- Introduced the team's first **automated test suite**, taking **9** integrations from **0%** coverage to **Jest** and **Specmatic** suites enforced in **CI** as a **70%** gate, maintained **Kubernetes and Docker** infrastructure with **OpenTelemetry** tracing, and helped migrate integrations from **AWS** to **Google Cloud**.

Projects

FormHook: Fault-Tolerant Webhook Delivery | *Node.js, TypeScript, BullMQ, Redis, AWS, Terraform*
- Built a distributed webhook delivery service with **job queues**, **exponential-backoff retries** and **dead-letter handling**, so a failing downstream endpoint degrades delivery rather than losing events.
- Added a live **failure-simulation mode** that injects errors and timeouts on demand, and provisioned the service on **AWS EC2** with **Terraform** so the whole environment stands up or tears down in **1** command.

Workflow Automation Platform | *React, React Flow, TypeScript, Node.js, Temporal*
- Built a **no-code automation platform** in the vein of Zapier and n8n, where users connect apps and APIs on a drag-and-drop **React Flow** canvas using triggers, conditions, loops and actions.
- Ran every automation on **Temporal**, so long-running workflows survive server restarts and resume where they stopped, with **automatic retries**, **live step-by-step run tracing** and a full run history.

Temporal vs Static Models for Depression Detection in Speech | *MSc Dissertation, PyTorch*
- Compared a **stacked RNN** against **Logistic Regression and Support Vector Machine** baselines on acoustic speech features, sweeping segment lengths from **32 to 1024** frames under a person-independent **5-fold** protocol.
- Showed the RNN's apparent gain (**73.5% vs 66.4%** accuracy) was not statistically significant under **paired t-tests** at any segment length, contradicting the starting hypothesis.
