# Gaurav Sidana

Glasgow, United Kingdom (open to relocation) • +44 7553 685160 • gauravsidana241@gmail.com
https://github.com/gauravsidana241 • https://linkedin.com/in/gaurav-sidana-7a5118242
https://gaurav-sidana.vercel.app • Right to work in the UK • No visa sponsorship required

## Education

**Master of Science (MSc) in Computing Science** *Sep 2025 – Sep 2026*
University of Glasgow *Glasgow, UK*

- Coursework: Machine Learning, Deep Learning, Natural Language Processing, Information Retrieval, Algorithms

**Bachelor of Engineering (BE) in Information Technology** *Feb 2021 – May 2023*
University of Mumbai (GPA 8.42 / 10.0) *Mumbai, India*

- Coursework: Data Structures, Algorithms (Java), Object-Oriented Programming, Full Stack Development (React)

## Technical Skills

**Languages:** TypeScript, JavaScript, Python, SQL, Java, Bash, HTML, CSS

**Tools and Frameworks:** React, Next.js, Vue.js, Redux, React Flow, Tailwind CSS, Vite, Webpack, Node.js, Express, Flask, GraphQL, Kafka, Temporal, BullMQ, PostgreSQL, MySQL, SQLite, MongoDB, Mongoose, Sequelize, Redis, Jest, Specmatic, Docker, Kubernetes, Terraform, AWS (EC2, S3, Lambda), Google Cloud, Vercel, OpenTelemetry, Prometheus, Grafana, Linux

**Concepts:** REST APIs, WebSockets, OpenAPI, Swagger, OAuth 2.0, Microservices, Event-Driven Architecture, Contract Testing, CI/CD, Infrastructure as Code, System Design, Agile / Scrum, Code Review

**Developer Tools:** Git, GitLab CI, GitHub Actions, Jenkins, Azure DevOps, VS Code, Jupyter Notebook

## Experience

**Software Development Engineer**, Fynd, Mumbai (B2B commerce platform) *Jan 2024 – Aug 2025*

- Led the migration of **9** external marketplace integrations onto the company's first **Temporal-orchestrated workflow engine**, rebuilding roughly **80** workflow stages across the order lifecycle and inventory synchronisation, and consolidating years of accumulated special-case logic into one model.
- Built the **no-code workflow builder** in **React, TypeScript and React Flow**: a drag-and-drop canvas where users assembled executable workflows as graphs, wiring loops and conditional branches, and extended the client-side interfaces in **Next.js** and TypeScript for each new integration.
- Ran inventory and order synchronisation against marketplace catalogues of up to **300,000** SKUs, integrating third-party **REST and GraphQL APIs** including **Shopify's GraphQL Admin API** and handling evolving schemas, partner rate limits and retry semantics.
- Handled **per-reseller partner credentials** across those integrations, authenticating against **Shopify, Flipkart** and other marketplace APIs on behalf of individual sellers so each one's catalogue and orders stayed tied to their own account.
- Built the company's first integration against **Amazon's VDF feed APIs** on **BullMQ and KafkaJS**, designing an ingestion layer that hides asynchronous feed completion and partner rate limits from callers so new orders keep being accepted while earlier submissions are still in flight.
- Introduced the team's first **automated test suite**, taking **9** integrations from **0%** coverage to **Jest** and **Specmatic** suites across unit, integration and performance layers, enforced in **CI** as a **70%** coverage gate on every merge.
- Instrumented services with **OpenTelemetry** tracing surfaced in **Grafana**, and maintained **Kubernetes and Docker** infrastructure across production and **2** development environments on **Google Cloud**.

**Software Development Engineer, Intern**, Fynd, Mumbai *Oct 2023 – Jan 2024*

- Debugged and improved **inventory systems** spanning **9** marketplace integrations in a live commerce environment.
- Collaborated with **cross-functional teams** to deliver new features across the same **9** integrations, and contributed to migrating their front end from **Vue.js** to **React**.

## Projects

**FormHook, Fault-Tolerant Webhook Delivery** (Node.js, TypeScript, BullMQ, Redis, AWS, Terraform) *2025*

- Built a distributed webhook delivery service with **job queues**, **exponential-backoff retries** and **dead-letter handling**, designed so a failing downstream endpoint degrades delivery rather than losing events.
- Added a live **failure-simulation mode** that injects downstream errors and timeouts on demand, and provisioned the service on **AWS EC2** with **Terraform** so the whole environment can be stood up or torn down in **1** command.

**Workflow Automation Platform** (React, React Flow, TypeScript, Node.js, Temporal) *2026 – Present*

- Built a **no-code automation platform** in the vein of Zapier and n8n, where users connect apps and APIs on a drag-and-drop **React Flow** canvas using triggers, conditions, loops and actions, so repetitive business processes run without anyone writing code.
- Ran every automation on **Temporal**, so long-running workflows survive server restarts and resume where they stopped, with **automatic retries** for failed API calls, **live step-by-step run tracing** and a full run history for debugging.

**Temporal vs Static Models for Depression Detection in Speech** (MSc Dissertation, PyTorch) *2026*

- Compared a **stacked RNN** against **Logistic Regression and Support Vector Machine** baselines for depression detection from acoustic speech features on the Androids Corpus, sweeping segment lengths from **32 to 1024** frames under a person-independent **5-fold** protocol.
- The RNN's apparent gain (**73.5% vs 66.4%** accuracy) was not statistically significant under **paired t-tests** at any segment length, contradicting the starting hypothesis.
